6. Since $1 \mathrm{~kg}=10,000 \mathrm{dg}, 2,400 \mathrm{~kg}=10,000(2,400)=24,000,000 \mathrm{dg}$.
7. If one number is 31 and the sum of two numbers is 68 , the missing number is then $68-31=37$. Therefore, the product of the two numbers is $31(37)=1,147$.
8. If $a=2 / 3, b=3 / 8$ and $c=3 / 4$, then $\frac{a b}{c}=\frac{\frac{2 \cdot 3}{3} \cdot \frac{3}{8}}{\frac{3}{4}}=\frac{\frac{1}{4}}{\frac{3}{4}}=\frac{1}{4} \div \frac{3}{4}=\frac{1}{4} \cdot \frac{4}{3}=\frac{1}{3}$.
9. There are a total of 7 friends. One friend forgot her money, which means 6 friends paid an extra $\$ 3.00$. This means that each friend would pay a total of $6 \cdot 3=\$ 18.00$. Since there were 7 friends, the total bill was $7 \cdot 18=\$ 126.00$.
10. It takes 54 seconds or $\frac{54}{60}=\frac{9}{10}$ minute to cut through a piece of wood. If an 8 -foot long piece of wood is to be cut into 8 equal sections, 7 cuts are needed. Therefore, it would take $7\left(\frac{9}{10}\right)=\frac{63}{10}=6.3$ minutes to cut an 8 foot long piece of wood into 8 equal sections.
11. The compound interest formula is $y=p\left(1+\frac{r}{n}\right)^{n t}$, where $y=$ amount, $p=$ principal, $r=$ rate, $n=$ number of times compounded per year and $t=$ time in years. From our problem, $p=\$ 1,900, r=4 \%, t=3$ and $n=2$, since it will be compounded semi-annually. Therefore, our function is $y=1900\left(1+\frac{0.04}{2}\right)^{2 \cdot 3} \rightarrow y=1900\left(1+\frac{0.04}{2}\right)^{6}$.
12. $(2 n)^{6}\left(\frac{9 n^{2 / 3}}{36 n}\right)^{3}=\left(2^{6} n^{6}\right)\left(\frac{1}{4 n^{1 / 3}}\right)^{3}=\left(64 n^{6}\right)\left(\frac{1}{4^{3} n^{1 / 3^{\cdot 3}}}\right)=64 n^{6}\left(\frac{1}{64 n}\right)=\frac{64 n^{6}}{64 n}=n^{5}$.
13. To find the surface area of a sphere, use the formula $S A=4 \pi r^{2}$. We are given a sphere with a diameter of 16 inches, so the radius is 8 inches. We are also given $\pi=3$. Substituting into the formula, the surface area of the sphere is $S A=4 \pi r^{2}=4(3)\left(8^{2}\right)=4(3)(64)=768 \mathrm{in}^{2}$.
14. To change a degree measure into a radian measure, multiply the degree measure by $\frac{\pi}{180}$. Therefore, $135^{\circ} \cdot \frac{\pi}{180}=\frac{135 \pi}{180}=\frac{3 \pi}{4}$ radians.
15. If we square both sides of $x+y=18$, we get $(x+y)^{2}=18^{2} \rightarrow x^{2}+2 x y+y^{2}=324$. Since we know $x^{2}+y^{2}=308$, we can substitute this to obtain $2 x y+308=324$. Subtract 308 from both sides to get $2 x y=$ 16. Divide both sides by 2 and $x y=8$. Therefore, $(x y)^{2}=8^{2}=64$.
16. If one secant and one tangent are drawn to a circle from one exterior point, then the square of the length of the tangent is equal to the product of the external secant segment and the total length of the secant, so from our picture $A B^{2}=D C \cdot D B$. Since, $A B=12$ and $C D=7$, we make the equation $12^{2}=x(x+7)$. Distribute and we get $x^{2}+7 x=144$. Subtract 144 from both sides to get $x^{2}+7 x-144=0$. This factors to $x-9=0$ and $x+16=0$, which solving each equation gives us $x=9$ and $x=-16$. A length cannot be a negative value, so $C B=9$ inches.
