13. There are 60 minutes in 1 hour. Therefore, 1.4 hours $=1.4(60)=84$ minutes.
14. A regular hexagon is the only regular polygon that can be divided into equilateral triangles?
15. To convert feet/second into miles/hour, multiply by $\frac{15}{22}$. Therefore, 88 feet $/$ second $=88\left(\frac{15}{22}\right)=60 \mathrm{miles} /$ hour.
16. First, label the rectangle as shown.

We can see there are 6 rectangles that require 1 section; $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}, \mathrm{E}$, and F . There are 4 rectangles that require 2 sections; $\mathrm{AB}, \mathrm{BC}, \mathrm{EF} \& \mathrm{DE}$. There are 4 rectangles that require 3 sections, $\mathrm{ABC}, \mathrm{DEF}, \mathrm{ABD}$, and CEF. There is only 1 rectangle that requires all ABCDEF. Therefore, there are a total of $6+4+4+1=15$ rectangles that can be found in the picture.
36. The positive integral factors of 80 are $1,2,4,5,8,10,16,20,40$, and 80 . The sum of all the positive integral factors of 80 is then $1+2+4+5+8+10+16+20+40+80=186$.
38. $y=(x-h)^{2}+k$ is the vertex form of a quadratic equation.
40. $17 \sqrt{24 a^{16}}=17 \cdot \sqrt{4 \cdot 6} \cdot a^{\frac{16}{2}}=17 \cdot 2 \sqrt{6} \cdot a^{8}=34 a^{8} \sqrt{6}$, and $n=8$. Therefore, $\sqrt{8}=\sqrt{4 \cdot 2}=2 \sqrt{2}$.
41. The formula for lateral surface area of a rectangular prism is $L=P h$, where $P$ equals the perimeter of the base and $h$ equals the height of the prism. The perimeter of the base can be found by $16+8+16+8=48$.

Therefore, the lateral surface area of the prism is $(48)(6)=288 \mathrm{~cm}^{2}$.
42. The formula for simple interest is $I=p r t$, where $I$ is the interest accumulated, $p$ is the principal amount, $r$ is the rate and $t$ is the time, in years. Remember that $8 \%=0.08$. Substituting into the formula and the interest will be $I=(600)(0.08)(3)=\$ 144$.
44. To solve the equation $|x-5|=31$, we must create two equations, which are $x-5=31$ and $x-5=-31$. Adding 5 to both sides in both equations gives us the solutions of 36 and -26 . Therefore, the positive difference of the solutions is $36-(-26)=62$.
46. If the angles in a triangle are in a ratio of $9: 11: 16$, then $9 x+11 x+16 x=180$. Simplify this to get $36 x=$ 180. Divide both sides by 36 and $x=5$. Therefore, the largest angle measures $16(5)=80^{\circ}$.
50. $3^{-2}+4^{-2}=x^{-2}$ is rewritten using positive exponents as $\frac{1}{3^{2}}+\frac{1}{4^{2}}=\frac{1}{x^{2}}$, which is equal to $\frac{1}{9}+\frac{1}{16}=\frac{1}{x^{2}}$. We can multiply the entire equation by the GCD of $144 x^{2}$, to get $144 x^{2}\left(\frac{1}{9}+\frac{1}{16}=\frac{1}{x^{2}}\right)=16 x^{2}+9 x^{2}=144$. This simplifies to $25 x^{2}=144$. Divide both sides by 25 and we get $x^{2}=\frac{144}{25}$. Square root both sides to get the positive root of $\frac{12}{5}$. Substitute $\frac{12}{5}$ into the expression $5 x-2^{3}$, to get $5\left(\frac{12}{5}\right)-2^{3}=\frac{60}{5}-8=12-8=4$.
