6. Given the number 2,976 , we see that $2+9+7+6=24$. The prime factorization of 24 is equal to $2^{3} \cdot 3$.
7. $0.42=\frac{42}{100}=\frac{21}{50}$. The reciprocal of $\frac{21}{50}$ is $\frac{50}{21}$.
8. $3 x-2 x^{2}$ is a polynomial made p of two terms and has a degree of 2 . Therefore, the polynomial $3 x-2 x^{2}$ is classified as a quadratic binomial.
9. The jets won 12 out of 20 games they played last season, and therefore lost 8 games. The ration of losses to wins is $8: 12$, which can be simplified to $2: 3$.
10. Since $a^{\frac{m}{n}}=\sqrt[n]{a^{m}}$ or $(\sqrt[n]{a})^{m}$, then $m^{\frac{7}{3}}=\sqrt[3]{m^{7}}$.
11. The geometric mean of $a$ and $b$ is equal to $\sqrt{a b}$. Therefore the geometric mean of 24 and 6 is equal to $\sqrt{24 \cdot 6}=\sqrt{144}=12.12$ is one more than the number 11 , and thus $M=11$.
12. One method to solve $(x-4)(x-4)+12=3 x$ is to first multiply the binomials and then we get $x^{2}-8 x+16+12=3 x$. Combining like terms and subtracting $3 x$ from both sides gives us $x^{2}-11 x+$ $28=0$. We can now factor the trinomial to get $(x-7)(x-4)=0$. Setting each factor equal to 0 and solving each gives us the solutions 7 and 4 and therefore, our solution set is $\{4,7\}$.
13. In order to subtract fractions, you must have common denominators. The common denominator of 3 and 8 is $24 . \frac{x}{3}=\frac{8 x}{24}$ and $\frac{x}{8}=\frac{3 x}{24} \cdot \frac{8 x}{24}-\frac{3 x}{24}=\frac{8 x-3 x}{24}=\frac{5 x}{24}$.
14. Let $P$ is the center of the circle and draw segment $\overline{Y P} . \overline{P Z} . \overline{X P}$ and $\overline{Y P}$ are all radii. Now we have $\triangle X P Y$ and since $X Y$ is equal to the radius of the circle, $\triangle X P Y$ is an equilateral triangle and $m \angle X P Y=$ $60^{\circ} . \angle X Z Y$ is an inscribed angle with endpoints of the central angle, $\angle X P Y$, and thus is $\frac{1}{2} m \angle X P Y=30^{\circ}$.
