5. Shiela had $\$ 500$ and gave $30 \%$ to her friend Alice. $30 \%$ of $\$ 500=0.3(500)=\$ 150$. Alice received $\$ 150$. Alice gave $12 \%$ of her money to her sister Frances. $12 \%$ of $\$ 150=0.12(150)=\$ 18$. Frances received $\$ 18$.
6. A dozen is equal to 12 items. $216 \div 12=18$, and $18(31)=558$ cookies.
7. The sum of the supplement and complement of an angle can be found by $270-2 n$, where $n$ is the angle measure. We are given the angle measure of $19.4^{\circ}$, so therefore, $270-2(19.4)=270-38.8=231.2^{\circ}$.
8. We are given the pattern, $2,2,3,7,12,22,41,75, \ldots$ It follows the pattern $a, b, c,(a+b+c), b+c+(a+b+c)$, and so forth. After the third term, you add the three previous terms to get the next term. The following tem of the sequence $2,2,3,7,12,22,41,75, \ldots$ is $22+41+75=138$.
9. Since distance $=$ rate $\times$ time, we have the equation $439.4=$ rate $\times 5.2$. Divide both sides by 5.2 and we have a rate of $84.5 \mathrm{ft} / \mathrm{sec}$.
10. The degree of a term is the sum of the exponents of the variables. The degree of a polynomial is the degree of the term with the highest degree. We are given a polynomial that has 6 terms, $14 x^{5}+4 x^{4}+3 x^{3}+2 x^{2}-6-x .14 x^{5}$ has a degree of $5,4 x^{4}$ has a degree of $4,3 x^{3}$ has a degree of $3,2 x^{2}$ has a degree of $2,-6$ has a degree of 0 and $-x$ has a degree of 1 . The highest degree of any term is 5 , and the degree of the polynomial $14 x^{5}+4 x^{4}+3 x+2 x^{2}-6-x$ is 5 .
11. $6\left(\frac{3 a^{3} b^{-2}}{9 a^{5} b^{-3}}\right)^{-2}=6\left(\frac{9 a^{5} b^{-3}}{3 a^{3} b^{-2}}\right)^{2}=6\left(3 a^{5-3} b^{-3-(-2)}\right)^{2}=6\left(3 a^{2} b^{-1}\right)^{2}=6\left(\frac{3 a^{2}}{b}\right)^{2}=6\left(\frac{9 a^{4}}{b^{2}}\right)=\frac{54 a^{4}}{b^{2}}$.
12. Let $x$ equal the constant multiplier. The area of the rectangle is $500 \mathrm{in}^{2}$, and if the ratio of the length to the width of the rectangle is 5:4, then we have $5 x(4 x)=500$. So, $5 x(4 x)=500$ gives us $20 x^{2}=500$. Divide both sides by 20 and $x^{2}=25$. Square root both sides and $x= \pm 5$. $x$ cannot be equal to -5 because that would give us negative dimensions, and that is not allowed, therefore, $x=5$. If $x=5$, then $5 x=5(5)=25$ and $4 x=4(5)=20$. The perimeter of the rectangle is then $2(25)+2(20)=50+40=90$ inches.
13. If $A=24 x^{2}-9 x+11$ and $B=-17 x^{2}+13 x-8$, the $A-B=\left(24 x^{2}-9 x+11\right)-\left(-17 x^{2}+13 x-8\right)=$ $24 x^{2}-9 x+11+17 x^{2}-13 x+8=41 x^{2}-22 x+19$.
14. When given a right triangle and an altitude drawn from the right angle to the hypotenuse, it creates three similar triangles. We can draw a picture to help us see the triangles,

Both sides and $x= \pm 15$. $x$ cannot equal -15 because negative lengths are not allowed, thus $x=15$.
44. The remainder of $\left(2 n^{3}+8 n\right) \div(n-1)$ can be found by using long division:
$n - 1 \longdiv { 2 n ^ { 2 } + 8 n } \rightarrow n - 1 \longdiv { 2 n ^ { 2 } + 8 n + 0 } \rightarrow n - 1 \longdiv { 2 n } \rightarrow \begin{array} { c } { 2 n } \\ { \frac { 2 n ^ { 2 } + 8 n + 0 } { n - 1 } } \end{array} \rightarrow \begin{array} { c } { \frac { 2 n + 1 0 } { 2 n ^ { 2 } + 8 n + 0 } } \\ { \frac { - ( 2 n ^ { 2 } - 2 n ) } { 1 0 n + 0 } } \\ { \frac { - ( 1 0 n - 1 0 ) } { 1 0 } } \end{array} .$
49. Given the function $h(t)=-16 t^{2}+144$. Replace $h(t)$ with 0 and we have $0=-16 t^{2}+144$. Add $16 t^{2}$ to both sides and get $16 t^{2}=144$. Divide both sides by 16 and $x^{2}=9$. Square root both sides and $x= \pm 3$. You cannot have a negative time, so the ball was in the air for 3 seconds.
