15. Let $A = 0.8\bar{4}$. If $A = 0.8\bar{4}$, then $10A = 8.\bar{4}$ and $100A = 84.\bar{4}$. $100A - 10A = 90A$ and $84.\bar{4} - 8.\bar{4} = 76$. We now have $90A = 76$. Dividing by 90 on both sides and $A = \frac{76}{90} = \frac{38}{45}$. Therefore, $0.8\bar{4} = \frac{38}{45}$.

22. Since 144 square inches = 1 square foot, $432 \div 144 = 3$ square feet.

25. To find the n^{th} term of an arithmetic sequence, use $a_n = a_1 + (n - 1)(d)$, where a_1 is the first term, n is the term position and d is the common difference. We are given the sequence 14, 22, 30, 38, ..., so $a_1 = 14$, $n = 12$ and $d = 8$. Substituting and we get $a_{12} = a_1 + (n - 1)(d) = 14 + (12 - 1)(8) = 14 + 88 = 102$.

27. We are given $A + B + C = 70$, $A + B = 27$ and $B + C = 51$. Since $A + B = 27$, substitute this into the first equation and now we have $27 + C = 70$. Subtract 27 from 70 and $C = 43$. Since $C = 43$, substitute into the last equation and $B + 43 = 51$. Subtract 43 from both sides and $B = 8$.

34. First, arrange the numbers 78, 50, 54, 66, 72, 34, 44, 49, 52 and 37 from least to greatest. We now have 34, 37, 44, 49, 50, 52, 54, 66, 72 and 78. The median is then the average of 50 and 52, which is 51. The upper quartile is then the median of the upper half of the data, which is 66 and the lower quartile is the median of the lower half, which is 44. The inter-quartile range is then $66 - 44 = 22$.

35. To find how many different orders the songs be played, use $7!$. $7! = 7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 5,040$ ways.

36. To find percent of change, use $\frac{\text{change in amount}}{\text{original amount}} \times 100$. Using our information, our percent of decrease is $\frac{64-40}{64} = \frac{3}{8} = 0.375 \times 100 = 37.5\%$.

41. Distribute the equation by the common denominator, $4x$. $4x \left(x + \frac{1}{x} = 4 + \frac{1}{4} \right)$. $4x^2 + 4 = 16x + x$ and moving everything to the left side to get $4x^2 - 17x + 4 = 0$. Factor $4x^2 - 17x + 4$ to get $(x - 4)(4x - 1)$. We now have $(x - 4)(4x - 1) = 0$, $x - 4 = 0$ and $4x - 1 = 0$ and $x = \left\{ 4, \frac{1}{4} \right\}$. So, $a = 4$ and $b = \frac{1}{4}$ and then $5ab = 5(4) \left(\frac{1}{4} \right) = 5$.

47. A quadratic equation in standard form is $y = Ax^2 + Bx + C$. To find the coordinates of the vertex of a parabola, use $\left(\frac{-B}{2A}, f \left(\frac{-B}{2A} \right) \right)$. We are given the parabola with equation $y = 2x^2 + 12x - 7$, so $A = 2$ and $B = 12$. Substituting, and the x -coordinate is $\frac{-B}{2A} = \frac{-12}{2(2)} = \frac{-12}{4} = -3$. Substituting -3 into the equation for x and solving for y , $y = 2(-3)^2 + 12(-3) - 7 = -25$. The vertex has coordinates $(-3, -25)$. After the translation, the new coordinates of the parabola are $(-3, -25) \rightarrow (x - 7, y + 18) \rightarrow (-10, -7)$.

49. If two chords in a circle intersect, then the products of the lengths of the segments of the chords are equal.

From our picture, $AE \cdot EB = CE \cdot ED$. We are given $AE = 6.5$, $CE = 4$ and $CD = 17$, so $ED = 17 - 4 = 13$. Now, since $AE \cdot EB = CE \cdot ED$, let $EB = x$ and then $6.5x = 4(13) = 52$. We have the equation $6.5x = 52$. Divide both sides by 6.5 and $x = 8$. Therefore, $EB = 8$.
